Bento UI System • Fake Offer Letter & Phishing Inspector

Visual direction based on the supplied palette reference

1. Design Direction

Use a restrained bento-grid interface: large rounded cards, generous spacing, strong typography, short information blocks, and clear hierarchy. Avoid an overly futuristic 'AI slop' appearance. The product should feel like a focused security utility rather than a generic AI landing page.

2. Color System

Token	HEX	Use
White	#F9F9F9	Primary text, high-contrast surfaces, main content areas.
Blue	#004E72	Primary actions, links, secondary emphasis, headings.
Orange	#FF6E42	Primary CTA, highlights, active states, key attention elements.
Navy Blue	#092634	Large cards, navigation, result surfaces, strong backgrounds.

The supplied reference image uses White #F9F9F9, Blue #004E72, Orange #FF6E42, and Navy Blue #092634. Use orange sparingly so the CTA and high-attention elements remain visually strong.

3. Visual Rules

- Background: predominantly Navy Blue with white/light content surfaces where useful.
- Cards: 18–24px corner radius.
- Spacing: use a consistent 8px spacing system; favor 16, 24, 32, and 48px gaps.
- Typography: one clean sans-serif family; use weight and size for hierarchy instead of decorative effects.
- Borders: subtle, low-contrast borders; avoid excessive glassmorphism.
- Shadows: soft and restrained; no glowing neon effects.
- Icons: simple line icons; do not mix many icon styles.
- Animation: short transitions only for scan progress, score reveal, and card state changes.

4. Desktop Bento Layout

Recommended 12-column grid with a maximum content width around 1200–1280px.

Area	Grid Size	Content
Header	12 columns	Logo/product name, small navigation, Scan status.
Hero / Input	8 columns	Headline, explanation, text/URL input, Analyze CTA.
Threat Preview	4 columns	Compact threat meter, trust message, example scan.
How It Works	4 columns	3-step scan process.
Live Signals	8 columns	Detected-signal cards / scan result.
Evidence	7 columns	Quoted evidence from submitted offer.
Domain Intelligence	5 columns	Domain age and URL metadata.
Action Card	12 columns	What the user should do next + rescan/new scan.

5. Suggested Screen Wireframe

Desktop composition:

LOGO	How it works	New Scan
Check before you trust. Analyze a job offer or URL. [Text] [URL] Paste suspicious offer... [Analyze for scam]	THREAT INDEX 87% HIGH RISK 4 signals detected	
HOW IT WORKS 01 Parse → 02 Detect → 03 Explain	DOMAIN INTELLIGENCE Domain age: 18 days	
DETECTED SIGNALS [Payment demand] [Urgency] [Contact mismatch] [Sensitive]		
EVIDENCE 'Pay ₹4,999 for equipment...'	AI EXPLANATION Short, plain-language explanation + next step	

6. Core Components

Component	Behavior	Visual Treatment
Mode switch	Toggle between Text and URL.	Small segmented control; active state in Orange.
Offer input	Paste text; auto-resize up to a practical limit.	White/light card with clear border.
Analyze CTA	Starts scan and disables duplicate submissions.	Orange filled button.
Scan progress	Shows Parse → Signals → Score.	Minimal step indicator; no fake terminal effects.
Threat Index	Displays score and risk band.	Large number, strong hierarchy, restrained meter.
Signal card	Shows severity, title, and evidence.	Bento card with compact icon and short copy.
Domain card	Shows domain age and relevant metadata.	Blue/Navy card with small metric blocks.
AI explanation	Explains why the signals matter.	Plain-language white card; 3–5 lines max.
New scan	Clears state and returns to input.	Secondary button.

7. Result State

The result screen should not look like a generic chatbot response. Make the score, evidence, and domain information the primary visual objects.

- Top-left: 'Scan complete' status.
- Top-right: threat score.
- Center: detected signals in a responsive bento grid.
- Lower section: evidence extracted from the submitted text.
- Side card: domain age when URL input exists.
- Bottom: AI explanation + recommended verification action.

8. Risk Visual Language

Level	Meaning	Treatment
Low	Few detected indicators.	Neutral/Blue emphasis; avoid claiming 'safe'.
Medium	Several indicators require verification.	Orange accent.
High	Multiple strong scam indicators.	Orange + strong text emphasis; clear caution.
Critical	Many strong indicators / payment demand.	High-contrast warning treatment without alarmist animation.

Do not use color alone to communicate risk. Always include text labels such as LOW, MEDIUM, HIGH, or CRITICAL and the underlying evidence.

9. Responsive Layout

- Desktop: 12-column bento grid.
- Tablet: 6-column grid; combine smaller cards.
- Mobile: 1-column stack; threat score remains near the top after input.
- Keep CTA full-width on small screens.
- Do not force horizontal scrolling.
- Maintain minimum comfortable touch targets.

10. Empty, Loading, and Error States

State	UI
Empty	Short prompt + sample input button.
Loading	Analyze button becomes 'Analyzing...'; show three lightweight steps.
Invalid input	Inline message explaining what is missing.
AI failure	Show a clear retry state; never fabricate a score.
Domain API failure	Continue text analysis and mark domain information as unavailable.
Success	Reveal score, signals, evidence, and explanation.

11. Sample Copy

Element	Copy
Hero	Check before you trust.
Subtitle	Analyze suspicious job offers and recruitment links for scam signals.
CTA	Analyze for scam
Result	Scam Threat Index
Evidence heading	Why this was flagged
Domain heading	Domain intelligence
Disclaimer	This is a risk assessment based on detected signals, not a definitive fraud determination.
Action	Verify the employer independently before paying or sharing sensitive information.

12. Accessibility

- Use sufficient text/background contrast.

- Do not rely only on orange/blue to distinguish states.
- Provide visible keyboard focus states.
- Use semantic buttons and form labels.
- Keep error messages adjacent to the relevant input.
- Support screen-reader-friendly headings and status messages.

13. Design Implementation Priority

1. Build the input + CTA card.
2. Build the threat score card.
3. Build signal cards.
4. Build evidence and AI explanation cards.
5. Add domain intelligence card.
6. Add responsive breakpoints.
7. Add micro-interactions only after the core UI is complete.

14. Definition of Done

- The page matches the four-color palette from the reference.
- The main scan interaction is understandable within a few seconds.
- The desktop result screen reads as a coherent bento grid.
- Mobile layout stacks without losing hierarchy.
- The score and evidence are visually dominant.
- The design avoids excessive gradients, glowing effects, or decorative AI imagery.
- The final screen is presentation-ready for a live hackathon demo.
